

The Independent Thinker's VACCINES FACT SHEET

Modern medicine tells us we must vaccinate our children. Vaccines are also developed for adults. Most of us believe these injections are “insurance policies” for our health. The reality is that vaccinations have never reduced the overall incidence of disease. Here are 10 facts you should know:

- 1.** Vaccines are made from lab-altered and/or genetically engineered pathogens grown (cultured) in animal blood, animal tissue, chicken embryos and aborted human fetal cells.
- 2.** Vaccine cultures are preserved with neurotoxins such as mercury (thimerosal), formaldehyde, phenol, aluminum and MSG. These toxins are directly injected into babies, children and adults, bypassing the Th1 immune system (the body's built-in filters: cilia, tonsils, skin).
- 3.** The proteins and oils in vaccines enter the body by way of *effraction* (injections breaking the skin), bypassing the digestive tract where they would normally be processed. The body's Th2 immune system responds by over-producing antibodies, which is in turn causing the high number of allergies in so many people today.
- 4.** Childhood vaccinations are the first assault on the normal functioning of the body, creating neurological damage and *debilitating* (not strengthening) the immune system.
- 5.** Vaccines, frequently administered in “cocktails,” as in MMR (measles, mumps, rubella) and PCV (containing 13 pneumococcal strains), subject children to multiple viral combinations that would never be found together in any natural setting.
- 6.** Children today are routinely vaccinated by pediatricians and medical professionals following CDC-recommended vaccination schedules. By age six, most children have been dosed with more than 100 vaccine antigens.
- 7.** With repeated injections, the damage caused by vaccines can lead to developmental problems, auto-immune disease, sudden infant death (SIDS), autism and more.
- 8.** One out of five American children now has “special needs.” These include learning disabilities, attention-deficit disorders, autism-spectrum disorders and behavioral issues, and have created a whole new market for prescription drugs.
- 9.** Polio and smallpox were *not* eradicated by vaccines. In fact, the rate of both diseases *increased* following the use of vaccines intended to prevent them. Smallpox and infectious diseases gradually declined with fresher food and improved sanitation, while polio – a product of radiation and the chemical age – persists today under many new names.
- 10.** Contrary to popular belief, parents are not legally obligated to vaccinate their children. Most states allow religious, philosophical and even medical exemptions for school and day-care attendance. Check *your* state's laws!
